Association between initial anthropometric status, physical activity and nutrition of adolescents in rural Bangladesh. To determine the relationship between anthropometric status, physical activity and nutrition in adolescents. Data on 2240 adolescents aged 12-18 years living in rural Bangladesh were collected using a nutrition questionnaire, an anthropometric survey and self-administered physical activity questionnaires. Overweight and obesity were the most prevalent anthropometric abnormalities, affecting 33% and 20% of the adolescents, respectively. The majority of adolescents were physically inactive with a mean of 1460 kcal/day energy intake. There were significant positive associations between overweight and obesity and nocturnal awakening, high-intensity physical activity, soft drink consumption and sedentary activities.
