

I want a brief flow of 'points' here so that it's easier to follow: sprint.csv
 sprintid,to_nxt 1234,1234 2347,2346 2346,2346 1234,2345 1234,2346
 1234,2346 1234,2347 1234,2348 2345,2346 2346,2346 2346,2346 2346,2346
 1234,1313 2348,2348 If this is my first process I want output like this: 1234: 5
 2346: 2 2345: 1 If I was to do it for a second time I'd get this result: 1234: 5
 2346: 3 2345: 2 2348: 0 How can I achieve this? What I tried was to split the CSV
 on spaces and then for each sprintid I just wanted to check how many times it
 appears in the 'to_nxt' column, if that is higher than zero then that sprintid will
 be processed, if not then it won't. Here is the code I wrote so far: import pandas
 as pd from collections import Counter df = pd.read_csv('sprint.csv') # Create
 dictionary for output df2 = {'points': 0} for idx, row in df.iterrows(): if
 row['sprintid'] in df2: df2['points'] += 1 else: # If the current'sprintid' has not yet
 been processed then I add it to a list that will be checked once the index is
 processed test = df2['points'] > 0 df2['points'].append(test) I know it's just basic
 logic but I am stuck on how to get the code to work and produce the desired
 result. A: Try this import pandas as pd from collections import Counter df =
 pd.read_csv('sprint.csv') # Create dictionary for output df2 = {'points': 0} df2['
