

There are many GPS-based post-processing software suites available for the user but they have varying degrees of awareness in the market and most are missing features. Post-processing software is essential as it is only by processing data that we can truly determine the accuracy of the data produced. Everyone wants the data in their hands but few take the time to process the data to remove errors. To add to the confusion, there are many different types of GPS receivers out there and some people simply refer to the GPS receiver as the GNSS receiver. As a result the software may be branded as being for specific brands of GPS receivers like Garmin, Trimble, Lowrance, and to some degree as being a software packages for statistical post-processing like dGPS, SPAN, TOPSAIL, and other software. This also means that some people have a mix of GP and GPS as their brand of GPS receiver. It is a constant adventure trying to define what is included in the software post-processing suite. Some of the post-processing software will not work with the receiver type while some may work with all brands of GPS receiver. GPS Insight was created for use with the GNSS software and is an amazing piece of software. It has the functionality of the many different software suites out there but it does it all in one package. It does much more than just converting the data into an Excel spreadsheet. It puts it into complete maps and gives you many more features than just adding a map into the field log, and much more of a user interface than most other software packages out there. It also allows you to import many different types of data and graphs into a complete set of maps so the software has the capability of many different types of post-processing and plotting.

#### Ashtech Solutions Post-processing Software Download

Hi There, I downloaded the post-processing software from the website, but cant get the entire set of data to work with ESRI. I have attempted at least 4 different ways to combine data from the C4Gnet/CORS. I could not get any of them to work so I moved on to mapping the data in GPS analit and get a lot of errors there also. I would appreciate any advice on how to get this all to work with ESRI. I have links to some of the people who have mapped and processed the data over on the following link: <http://earth.usgs.gov/news/2017/02/gps-utils-post-processing.php> I would like to know how I go about getting the post-processing software to work with ArcGIS 9.3.1. I am using CORS data. I am coming from a different research program and they provided me with post-processing data to look at.

The data has been adjusted/relocated to close to a set of points for each of the 5 satellites that was used. The software is Post Processing Software/GNSS-Solutions. I also used the ArcGIS tool, Reference Point Shortening. I used the ArcGIS 9.3.1 table to add coordinates and Geoid model information. They have two different files. The first of the two is a zip file containing the JBOSS, this is a file for the Windows systems. The second is a rar file containing the post-processing software and it's working on the Mac systems As mentioned, I am using the same GPS software as you i.e. MobileMapper Pro version 5, is it correct to assume that i cannot transfer any of these data for post-processing with the PostProcess Tool for that reason I'm having problems with it and i'm having no clue how to solve it. 5ec8ef588b
