## Edius Aurora Craft

today we are announcing the release of the edius x aurora workflow (version 1.0). we are proud to be the first broadcast workflow vendor to offer such a workflow. edius x aurora is built on top of the grass valley aurora workflow. our product management team has spent many months working closely with grass valley to ensure a seamless integration. i also want to emphasize that the workflow you will see in this tutorial is a production-ready workflow. it has been meticulously tested and you can download it directly from the grass valley website. by using the workflow you will learn the same techniques as those who have created hundreds of hours of great content with edius x. the first module is the aurora viewer. it is a standalone application that allows users to view media stored on aurora servers as well as other storage solutions. the aurora viewer can also be used as a server to playback media from other sources (e.g. an avid transport). to view your content, the aurora viewer needs to be paired with the aurora server. this is a standalone module that can be used to add additional servers to the system. the second module is the aurora server. it is the base platform for the entire workflow. it allows for the addition of further modules, each of which provides a specific functionality. it is a server-side application that can be installed on your workstation, on a dedicated server, or on a cloud server. it is the backbone of the entire workflow. the third module is the aurora server manager. this application is a web-based tool that allows managing all of your servers. it provides remote control and monitoring features of your servers. it can also be used as a standalone module if you want to manage all of your servers from a single platform. 5ec8ef588b
